

# Helium Reservoir

## Description

The helium reservoir was developed to facilitate the leakage testing of containment systems. Its function is to contain and release helium into a sealed chamber/containment system after a pre-determined amount of time: a mass spectrometer is then used to detect any helium leaking from the containment system.

Various filler liners are available to place within a containment system to reduce the cavity volume in order to obtain the required helium concentration.

Component dimensions and materials are dependant on customer requirements.
